

Conclusion to Flask Fundamentals

 <https://github.com/learn-co-curriculum/python-p4-v2-flask-fundamentals-conclusion>  <https://github.com/learn-co-curriculum/python-p4-v2-flask-fundamentals-conclusion/issues/new>

Learning Goals

- Describe the components of a web application framework.
 - Build and run a Flask application on your computer.
 - Manipulate and test the structure of a request object.
 - Extend a Flask application to meet the unique requirements of different projects.
-

Key Vocab

- **Web Framework:** software that is designed to support the development of web applications. Web frameworks provide built-in tools for generating web servers, turning Python objects into HTML, and more.
 - **Extension:** a package or module that adds functionality to a Flask application that it does not have by default.
 - **Request:** an attempt by one machine to contact another over the internet.
 - **Client:** an application or machine that accesses services being provided by a server through the internet.
 - **Web Server:** a combination of software and hardware that uses Hypertext Transfer Protocol (HTTP) and other protocols to respond to requests made over the internet.
 - **Web Server Gateway Interface (WSGI):** an interface between web servers and applications.
 - **Template Engine:** software that takes in strings with tokenized values, replacing the tokens with their values as output in a web browser.
-

Conclusion

Flask gives us the ability to take all of the Python and SQL code we built in Phase 3 and serve it to users on the internet. In this module, we learned a number of skills that will help us make flexible and powerful websites later on:

- Configuring WSGIs and web servers.
- Routing to views at fixed and parameterized URLs.
- Using application and request context to deliver information from the internet to our views.

In the next module, you will learn the following skills:

- Creating databases and integrating them in Flask applications with Flask-SQLAlchemy and Flask-Migrate.
