

Flask-SQLAlchemy Validations Lab (CodeGrade)

 <https://github.com/learn-co-curriculum/python-p4-validation-flask-sqlalchemy-validations-lab>  <https://github.com/learn-co-curriculum/python-p4-validation-flask-sqlalchemy-validations-lab/issues/new>

Learning Goals

- Define validations in data processing.
 - Ensure that only acceptable input is sent to the database using validations.
-

Key Vocab

- **Constraint:** a rule enforced on the data columns of a table. Ensures that only appropriate data is saved to the database.
 - **Validation:** an automatic check to ensure that data entered is sensible and feasible.
 - **Forms:** A web form (or HTML form) is a place where users enter data or personal information that's then sent to a server for processing.
-

Introduction

This is a **test-driven lab**.

Run `pipenv install` to create your virtual environment and `pipenv shell` to enter the virtual environment.

```
pipenv install && pipenv shell
```

This project has starter code for a couple of models, `Author` and `Post`. To get create the database from the initial migration, run:

```
$ cd server  
$ flask db upgrade  
$ python seed.py
```

Basic Validations

Add validators to the `Author` and `Post` models such that:

1. All authors have a name.
2. No two authors have the same name.
3. Author phone numbers are exactly ten digits.
4. Post content is at least 250 characters long.
5. Post summary is a maximum of 250 characters.
6. Post category is either `Fiction` or `Non-Fiction`.
7. Post title is sufficiently clickbait-y and must contain one of the following:
 - "Won't Believe"
 - "Secret"
 - "Top"
 - "Guess"

You should not need to run another migration, unless you altered model constraints.

Run `pytest -x` to run your tests. Use these instructions and `pytest`'s error messages to complete your work in the `server/` folder.
